Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon substrates

Claim 17; Page 144-145; 156pp; English

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopertenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and asteaxanthin, by using microorganism having a nucleic acid molecule encoding enzymes in

ö
the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Pantoea stewartii phytoene synthase (CTLB) enzyme used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               a
carotenoid biosynthesis in an organism, by over-expressing (I) in an organism, such that the carotenoid biosynthesis is altered in the organism. (I) and the genes encoding (I) are useful for converting phytoene to the carotenoids, for creating recombinant organisms that have the ability to produce various carotenoid compounds, and also for enhancing or manipulating carotenoid compounds. (I) can also be used for producing gene products having enhanced or altered activity
                                                                                                                                                                                                                                                                                                                                                                                       120
                                                                                                                                                                                                                                                                                                                                                                                                                             120

Ö
adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crf8, crt8, crt1, crt2, crt2, crtx, ortx, crtx, crtx, ortx, ortx, ortx, ortworted are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucosides, adonixanthin-3'-carotenoid glucosides are used as food additives. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          240
                                                                                                                                                                                                                                                                                                                                                                                                                                   180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes beta-carotin hydroxylase. Beta-carotene can be used in the preparation of xanthophylls and their metabolites. The present sequence represents an Erwinia uredovora crtB protein sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes the production of a vegetable component in an animal in which a gene participating in the synthesis of a vegetable component is introduced to an animal and expressed in the animal. Also described is the preparation of an oxidative stress-resistant animal in which a gene participating to the synthesis of a vegetable component having antioxidative activity, anti-lipid oxidative activity, cancer preventive activity or cancer growth inhibiting activity is introduced to

Brwinia herbicola phytoene synthase (AAW16492) catalyses the biosynthesis of phytoene, a precursor of the red carotenoid lycopene, from geranylgeranyl pyrophosphate. Its expression in transgenic plant material can be utilised as a means of visually distinguishing such material from non-transgenic cells and tissues. Novel binary vector pEr0203 (ATCC 97282) includes an expression cassette comprising the tomato EB promoter (see also AAT66533), a plastid targetting signal (AAT66535) fused to the phytoene synthase gene (AAT6634), and a 3' non-translated region (AAT66536). Transgenic plant cells and tissues are identified by the appearance of orange colour. (Updated on 17-0CT-2003 to standardise OS

The invention specifically describes the isolation of a 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) reductase protein. This sequence represents the Candida utilis crtB protein which is used in the method of the invention. (Updated on 17-OCT-2003 to standardise OS field)

```
Increasing prodn. of total carotenoid(s) in a higher plant - by transforming with vector encoding chloroplast transit peptide operably linked to the Erwinia herbicola lycopene cyclase structural gene.
```

Example 4; Fig 4; 99pp; English.

The present sequence is that of the Erwinia herbicola phytoene synthase which acts on geranylgeranyl pyrophosphate (GGPP) (produced by the action of GGPP) approphosphate and dependently layly pyrophosphate). GGPP is a 20-carbon atom precursor of phytoene, the first carotenoid in the carotenoid biosynthesis pathway. Production of total carotenoids in a plant can be increased by transforming the plant with DNA encoding enzymes involved in the biosynthesis pathway, in particular the lycopene syclass gene (AAT40795). Lycopene is prepared biosynthetically from phytoene through four sequential dehydrogenation reactions which can be carried out by a single dehydrogenase (AAT40793) in Erwinia sp. Beta-carotene is produced by the tobacco libulose bis-phosphate carboxylase-oxygenase gene (see AAT40794) is operatively linked in frame to the 5' end of the lycopene cyclase structural gene. This leads to increased production of total carotenoids in the chloroplast of transformed plants as compared to native, non-transformed plants of the same type. Beta-carotene is an effective and apparently harmless food colourant and is also in the pathway for biological synthesis of further C40 carotenoids such as zeaxanthin and zeaxanthin diglucoside. E. herbicola phytoene synthase encoded by pARC285.

(first entry)

E. herbicola, geranylgeranyl pyrophosphate synthase, pARC376, GGPP synthase, blosynthesis, carotenoid; lycopene; farnesyl pyrophosphate, phytoene; FPP, isopentyl pyrophosphate, IPP, tail to tail dimerisation; phytoene synthase; phytoene dehydrogenase-4H; food colourant; herbicide, norflurazon.

RESULT 13

This sequence represents Erwinia herbicola phytoene synthase encoded by plassing places. The plantage is an enzyme which is involved in the plosynthesis of carotenoids, esp. lycopene, from the ubiquitous of carotenoids, esp. lycopene, from the ubiquitous precursor, farnesyl pyrophosphate. In E. herbicola, phytoene has been found to be formed blosynthetically in a two-step process. The initial step is the condensation of farnesyl pyrophosphate (PPP) and isopentyl pyrophosphate. Lycopene is immediately followed by a tail to tail thy towns. Lycopene is produced from phytoene by the catalytic action of phytoene dehydrogenase. He lycopene commercial production of lycopene which is used as a food colourant. Commercial production of lycopene which is used as a food colourant. Planta transformed with the phytoene dehydrogenase. He coding sequence are protected from the herbicide norflunazon. (Updated on 25-MAR-2003 to correct PF field.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence encodes wild type phytoene synthase. Phytoene synthase is an enzyme which, along with geranylgeranyl pyrophosphate (GGPP) synthase (see also AAT4174.42), catalyse the formation of carotenoids, particularly phytoene. An N-terminal by truncated form of GGPP synthase which has the first thirteen amino acids replaced by four heterologous amino acids derived from the plasmid pARC306A was found to be about twice as the wild type enzyme. A C-terminal truncated protein was cound to have even higher activity and was cloned into plasmid pARC489D. The phytoene synthase coding sequences may be attached to the transit peptide coding sequence given in AFM4.744, for transport into tobacco chloroplasts. This allows the tobacco plants to produce high levels of phytoene for use in the treatment of skin disorders. (Updated on 25-MAR-2013) to correct PP field.) (Updated on 16-OCT-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transformed plants containing DNA encoding Erwinia herbicola enzymes - esp. geranyl:geranyl pyrophosphate synthase and phytoene synthase, allows large scale production of phytoene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

The DNA molecule comprises at least 1125 bp and is present in the plasmids paRC147, paRC1509, paRC1510 and paRC1510. The present sequence represents amino acid corresponding to the structural gene for phytoene synthase. The new DNA molecule can be used to produce the recombinant enzyme and transgenic organisms, e.g. yeasts or plants, with increased beta-carotene levels. Beta-carotene is used as a colourant in margarine and butter and as an intermediate for vitamin A, and may prevent cancer. (Updated on 25-margarine correct PF field.) (Updated on 17-OCT-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA encoding Erwinia herbicola lycopene cyclase - for producing recombinant enzyme, and transgenic organisms with increased beta-carotene

Danchin A; Kunst F, Frangeul L, Glaser P, Duchaud E, Taourit S, Buchrieser C; Genomic sequence of Photorhabdus luminescens and encoded polypeptides useful e.g. as therapeutic antimicrobials and agricultural pesticides

WPI; 2003-148459/14.

Claim 2; SEQ ID NO 3221; 1205pp; French.

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and

               genes, proteins, vectors containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of funan diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                           72

Natl. Acad. Sci. U.S.A. 87:9975-9978 (1990)
-!- FINCTION: This enzyme converts phytocene into lycopene via the intermediaries of phytofluene, zeta-carotene and neurosporene by the introduction of four double bonds.
-!- COFACTOR: FAD (Probable)
-!- PATHWAY: Carotenoid biosynthesis.

Bartley G. E., Schnidhauser T.J., Yanofsky C., Scolnik P.A.;
Carotenoid desaturases from Rhodobacter capsulatus and Neurospora crassa are structurally and functionally conserved and contain domains homologous to flavoprotein disulfide oxidoreductases.";
J. Biol. Chem. 265:16020-16024(1990).
J. FUNCTION: This enzyme converts phytoene into zeta-carotene via intermediary of phytofluene by the symmetrical introduction of double bonds at the C-11 and C-11 positions of phytoene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bartley G.B., Scolnik P.A.; Carotenoid biosynthesis in photosynthetic bacteria. MA Cluster of structural and regulatory genes for light-induced carotenogenesis in Myxococcus xanthus.";
FUNCTION: This enzyme converts phytoene into zeta-carotene via tintermediary of phytofluene by the symmetrical introduction of the double bonds at the C-11 and C-11' positions of phytoene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Carotenoid biosynthesis; Oxidoreductase; FAD; Flavoprotein; NAD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DB 1; Length 517;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- COFACTOR: FAD (Probable).
-!- PATHWAY: Carotenoid biosynthesis.
-!- SIMILARITY: Belongs to the phytoene dehydrogenase family.

Mol. Gen. Genet. 252:658-666[1996].
-!- FUNCTION: This enzyme converts phytoene into zeta-carotene via intermediary of phytofluene by the symmetrical introduction of double bonds at the C-11 and C-11' positions of phytoene.
-!- COPACTOR: PAD (Probable).
-!- COPACTOR: PAD (Probable).
-!- PATHWAY: Carotenoid biosynthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bacteria; Actinobacteria; Actinobacteridae; Actinomycetales;

-!- COFACTOR: RAD [Probable].
-!- PAITHWAY: Carotenoid biosynthesis.
-!- SIMILARITY: Belongs to the phytoene dehydrogenase family.

"Cloning, sequence, and photoregulation of al-1, a carotenoid biosynthetic gene of Neurospora crassa.";

Mol. Cell. Biol. 10:5064-5070(1990).

-!- FUNCTION: This enzyme converts phytoene into zeta-carotene via intermediary of phytofluene by the symmetrical introduction of double bonds at the C-11 and C-11' positions of phytoene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Probom; PD139017; Phytn dehydro; 1.

Fontes M., Ruiz-Vazquez R.M., Murillo F.J.;

Forwth plase dependence of the activation of a bacterial gene for carotenoid synchesis by blue light.";

EMBO J. 12:1265-1275(1993).

-!-FUNCTION: This enzyme converts phytoene into lycopene via the intermediaries of phytofluene, zeta-carotene and neurosporene b the introduction of four double bonds (By similarity).

-!-COPACTOR: PAD (Probable).

-!-COPACTOR: PAD (Probable).

-!- PATHWAY: Carotenoid biosynthesis.

-!- RATHWAY: Belongs to the phytoene dehydrogenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     36;

Submitted (MAR-1994) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: This enzyme converts phytoene into zeta-carotene via
intermediary of phytofluene by the symmetrical introduction of
double bonds at the C-11 and C-11' positions of phytoene.
-!- COFACTOR: PAD (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Fungi; Zygomycota; Zygomycetes; Mucorales; Mucoraceae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ProDom; PD139017; Phyth dehydro; 1.

Carotenoid biosynthesis; Oxidoreductase; FAD; Flavoprotein; NAD;

    -!- PATHWAY: Carotenoid biosynthesis.
    -!- SIMILARITY: Belongs to the phytoene dehydrogenase family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                            01-0CT-1996 (Rel. 34, Created)

-1- FUNCTION: This enzyme converts phytoene into zeta-carotene via intermediary of phytofluene by the symmetrical introduction of double bonds at the C-11 and C-11' positions of phytoene.
-1- COFACTOR: PAD (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bukaryota; Fungi; Ascomycota; Pezizomycotina;
